Abstract

The Smart Belongings Recovery System for Campus is a web-based application designed to simplify and secure the process of reporting, tracking, and recovering lost and found items within a campus. It provides a centralized platform where students can report lost or found belongings, upload images, track item status, and receive real-time notifications. The system includes a QR tag feature for registered smart gadgets, enabling quick identification without revealing personal details, along with OTP-based verification to ensure secure recovery. The application offers separate student and admin panels for managing reports, users, devices, and recovery processes. Built-in security features such as email verification, password hashing, session-based authentication, and role-based access improve efficiency, transparency, and security compared to traditional manual methods. Developed using HTML, CSS, JavaScript and Bootstrap for the frontend, PHP for backend processing, and MySQL as the database, the application runs on a XAMPP local server environment, making it a low-cost, campus-specific alternative to social media groups, generic lost-and-found portals, and expensive hardware trackers.
